-I- FUNCTION: This PTPase activity may directly link growth factor receptors and other signaling proteins through protein-tyrosine phosphorylation. The SH2 regions may interact with other cellular components to modulate its own phosphatase activity against interacting substrates.

-I- CATALYTIC ACTIVITY: Protein tyrosine phosphate + H(2)0 = protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   "A family of proteins that inhibit signalling through tyrosine kinase receptors.";

SUBUNIT: Binds PTPNS:
SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
PTM: Phosphorylated by tyrosine-protein kinases (By similarity).
SIMILARITY: Belongs to the protein-tyrosine phosphatase family.
Non-receptor class subfamily.
SIMILARITY: Contains 2 SH2 domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                              PARTIAL SEQUENCE.

-!- TISSUE SPECIFICITY: HIGHEST EXPRESSION IN BONE MARROW. ALSO
EXPRESSED IN KIDNEY, LUNG, OVARY, SPLEEN, THYMUS AND LYMPH NODE.
-!- DEVELOPMENTAL STAGE: EXPRESSED IN THE EMBRYO FROM DAY 15.5.
-!- SIMILARITY: BELONGS TO THE NON-RECEPTOR CLASS OF THE PROTEIN-
TYROSINE PHOSPHATASE FAMILY.

New phosphatase and kinase enzyme(s) - useful in the diagnosis and treatment of signal transduction disorders.

Claim 11; Fig 3a-d; 138pp; English

This polypeptide comprises a novel human protein tyrosine phosphatase (PTP), designated brain derived phosphatase 1 (BDP-1), that is expressed in most tissues and cell lines at basal level, but expressed high in epithelium origin cell lines and cancer cell lines. The amino acid sequence was deduced from a cDNA clone (see AAV17099) isolated from a haematopoietic MEGO1 cDNA library. The invention relates to novel proteins (see AAW4996-14) involved in cellular signal transduction and to the nucleic acids (see AAV17097-99) coding for them, and provides

The present sequence represents a novel murine non-receptor protein tyrosine phosphatase of hematopoietic stem cells (PTP HSC). This protein tyrosine phosphatase of hematopoietic stem cells (HSCS) or progenitor cells, and lacks expression in adult tissues. The protein has a N-terminal tyrosine phosphatase domain, followed by a region rich in serine, threonine and proline and a C-terminal region of about 15-25 amino acids which is rich in basic amino acid residues. The protein is capable of tyrosine dephosphorylation in hematopoietic progenitor cells, and functional derivatives of such native tyrosine phosphatases. The progenitor cell can be used in an assay for the identification of PTP HSC or angonists or agonists. The antagonist can be used to induce the interpretation of stem cells, such as undifferentiated malignant can be used for the expansion of undifferentiated stem cells which may facilitate their creatment. The PTP HSC or an agonist antibody against the PTP HSC can be used for the expansion of HSC prior to autologous or heterologus bone constructed stem cells in cell culture themselves the present action of the present action of the present action of the present action of the present action of the present action of the present action of the present action of the present action of the present action of the present action of the present action of the present action of the present action of the expansion of undifferentiated stem cells in vivo undifferentiated stem cells in vivo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              TVDYVROLLLITOMIPPDFSLFDVVLKMRKORPAAVQTBEQYRFLYHTVAQMFCSTLQNAS 300

GAPAGAGSGTQTGTGARSAEEAPLYSKVTPRAQRPGAHAEDARGTLP-GRVPADQSPA 419
             New human kinases and phosphatases and polynucleotides, useful for diagnosing, treating or preventing autoimmune or inflammatory disorders (e.g. AIDS, allergy or anemia), multiple sclerosis, ostecarthritis, cancer or hepatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel isolated polypeptide which is a human kinase and phosphatase (KPP). The KPP polypeptides, polymotheotides, agonists and antagonists are useful for diagnosing, treating or preventing cell proliferative disorders such as atherosclerosis, cirrhosis, hepatitis and cancer, developmental disorders e.g. mental retardation, neurological disorders including Alzheimer's disease and Parkinson's disease, autoimmune and inflammatory disorders such as

This polypeptide comprises a novel rat protein tyrosine phosphatase, designated PTP20, that regulates growth factor stimulation of cellular differentiation. Its amino acid sequence was deduced from a cDNA clone (see AAV17097) isolated from a rat phaeochromocytoma PC12 cDNA library by PCR amplification using primers based on consensus sequences (see AAV17097) of known PTPs. The invention relates to novel proteins (see AAV17097-99) coding for them, and provides vectors, host acids (see AAV17097-99) coding for them, and provides vectors, host acids (see AAV17097-99) coding for them, as well as methods for the diagnosis and treatment of diseases associated with the novel proteins. Corley PTP20, activators may act as anti-cancer therapeutics that stimulate cell differentiation rather than proliferation, while inhibitors may be useful for treating neural injuries by delaying the differentiation of transplanted neuronal stem cells until they are firmly grafted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        61 RYKDVVPYDETRVILSLLQEEGHGDYINANFIRGTDGSQAYIATQGPLPHTLLDFWRLVW 120

The present sequence represents a partial human non-receptor protein tyrosine phosphatase of hematopoietic stem cells (PTP HSC). This protein tyrosine phosphatase of hematopoietic stem cells (HSCS) or progenitor cells, and lacks expression in adult tissues. The protein has a N-terminal tyrosine phosphatase domain, followed by a region rich in serine, threenine and proline and a C-terminal region of about 15-25 amino acids which is rich in basic amino acid residues. The protein is capable of tyrosine dephosphorylation in hematopoietic progenitor cells, and functional derivatives of such native tyrosine phosphatases. The phosphatase domain of the PTP HSC or a PTP HSC-expressing HSC or progenitor cell can be used in an assay for the identification of PTP HSC or appropriate or agonists. The antagonist can be used to induce the differentiation of stem cells, which may facilitate their hematopoietic cells, e.g. leukaemia cells, which may facilitate their creation of stem cells, antibody against the PTH HSC can be used for the expansion of HSC prior to autologous or heterologous bone marrow transplantation), while the agonist antibody along with a hematopoietic growth factor can be used for the expansion of used for the expansion of used for the expansion of used for the expansion of undifferentiated stem cells in cell when the matopoietic growth factor can be used for the expansion of undifferentiated for the expansion of undifferentiated for the expansion of the object of the expansion of the object of the expansion of the object of the expansion of the object of the expansion of the object of the expansion of the object of the expansion of the object of the expansion of the object of the expansion of the object of the object of the expansion of the object of the expansion of the object of the object of the object of the object of the object of the object of the object of the object of the object of the object of the object of the object of the object of the object of the object of the object of the object of the ob

The non-catalytic portion of the phosphatase conclains unique sequences, including five PEST sequences rich in Pro, Glu or Asp, Ser and Thr. Z70PEP shares about 70% sequence identity with the human cytoplasmic phosphatase Lypl. Lyp proteins are important for regulation of T cell antigen and cytokine receptor signalling and for early and late stages of T cell differentiation. Z70PEP has immunosupressive activity. Compounds that increase expression of Lyp protein can be used as immunosupressive agents to reduce or prevent T cell activation or proliferation, to control thymocyte differentiation, to treat autoimmune diseases and transplant situations New nucleic acid encoding intracellular tyrosine phosphatase and related proteins, used to modulate signaling through T cells, particularly as 27. .288 /label= PTPase domain /note= \_catalytic protein tyrosine phosphatase domain" Lymphoid Protein Tyrosine Phosphatase; Lyp protein; lymphoid cell; intracellular tyrosine phosphatase; PTPase; lymphocyte; murine; protein tyrosine kinase; PTKS; immunosuppressant; PEST sequence; T cell antigen receptor signalling; autoimmune disease; transplant; cytokine receptor signalling. The present sequence represents human PTP04. The above proteins, other than ALK-7, are protein tyrosine phosphatases (PTPs) and are used to identify
PTP04; PTP05; PTP10; SAD; ALP; ALK-7; protein tyrosine phosphatase; type I receptor serine/threonine kinase; cancer; leukaemia; lymphoma; neurodegenerative disease; neuronal survival; Alzheimer's disease; Parkinson's disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New nucleic acid encoding specific protein tyrosine phosphatases for identifying specific modulators for treatment and prevention cancer and neurodegenerative disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ů,

substances that modulate their activity (i.e. agonists and antagonists, including NBP) in vivo or in vitro. These substances are used to treat or prevent diseases associated with abnormal signal transduction pathways that involve the proteins, particularly cancer (e.g. leukaemia and lymphoma), while modulators of ALK-7 (which is a type I receptor particularly for treating Alzheimer's, Parkinson's or Huntington's diseases. Nucleic acid fragments of the polynucleotides encoding the proteins can be used as probes to identify and clone related sequences; to detect protein-encoded RNA, to generate transgenic animals and in gene therapy (optionally after mutation). Ab are used to determine the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a method for examining ischaemic conditions; comprising measuring the expression levels of particular genes (I) in a test sample or determining the expression profile of a gene group in the sample comprising genes selected from (I). The method is useful for examining the ischaemic condition (e.g. compressive

ischaemia, occlusive ischaemia or vasospastic ischaemia) by measuring expression levels of particular genes (AB199202 to AB199912, encoding the protein sequences in ABB57020 to ABB57047) or by determining the expression profile of a gene group comprising these genes. The expression indicator expression profiles produced by these genes are used as an indicator when screening for ischaemic condition-improving drugs or therapeutics for ischaemic condition-improving drugs or primers for a mouse ischaemic condition related sequence, which are used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                           ESRSVYQLQYMSWPDRGVPSSPDHMLAMVEBARRLQGSGPBPLCVHCSAGCGRTGVLCTV 242

for treating diseases which are related to cell, inflammation and angiogenesis especially Novel therapeutic agents f proliferation, migration, cancer.

Claim 4; Fig 24; 91pp; English

This is the amino acid sequence of human protein tyrosine phosphatase (PTP) PEST is a soluble PTP that is ubiquitouelly expressed throughout embryonic development and in murine adult tissues. The N-terminal portion of the enzyme encodes for the catalytic domain, while the C-terminal portion is composed of 5 proline rich domains, and a binding site for the adaptor protein Shc. The pro 2 domain is required for paxillin binding, and the synthesis of mutant PTP-PEST have shown that proline 362 is important for paxillin binding activity. The invention relates to a compound that is capable of interfering with the binding of PTP-PEST to signalling molecules that are involved in cell migration, adhesion or division. The compound can be derived from minimal migration, adhesion or division. The compound can be derived from minimal compenses found in binding sites of PTP-PEST. The invention also relates to a method for finding a genuine substrate for an enzyme in a cell that norphaseses the wild type form of the enzyme. A mutant version of PTP-PEST (see AAV67251 and AAV67253) is used in this method. The compounds have cytostatic and antiinflammatory activity. The compounds proliferation, migration, inflammation and angiogenesis, especially proliferation, migration, inflammation and angiogenesis, especially cancer. The novel method is used for identifying a genuine substrate for enzyme

The present invention relates to protein-protein interactions and complexes involved in Transforming Growth Factor (TGF) beta disorders and/or diseases. The complex between two interacting proteins is useful for screening molecules that inhibit TGF beta for diagnosing or treating

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             8
                                                                                                                                                                                                                                                   The present protein sequence is that of the cytoplasmic, Lymphoid Protein Tyrosine Phosphatase, Lyp2 protein that has a single catalytic domain. The non-catalytic portion of the phosphatase contains unique sequences, including a single PEST sequence rich in Pro, Glu or Asp, Ser and Thr. It is expressed significantly in fetal liver and in resting lymphoid cells. Lyp2 is an isoform of the Lyp1 gene that arises by alternative splicing of the mRNA. The intronic sequence of Lyp1 encodes for the C-terminal 7 aminoacids and part of the 3'untranslated region of Lyp2. Lyp2 shares sequence identity with the murine phosphatase Z70PEP. Lyp proteins are important for regulation of T cell antigen and cytokine receptor signalling and for early and late stages of T cell differentiation. Lyp2 has immunosuppressive activity. Compounds that increase expression of Lyp protein can be used as immunosuppressive agents to reduce or prevent T cell activation or proliferation, to control thymcoyte differentiation, to treat autoimmune diseases and transplant situations
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             4

The invention relates to identifying agents which alter the interaction between a protein tyrosine phosphatase (PTP) and a tyrosine phosphatase (PTP) and a tyrosine phosphatylated polypeptide using fluorescence energy signals. The methods are useful for performing screening assay to identify agents that alter PTP binding to and PTP-mediated catalytic dephosphorylation of phosphotyrosine peptide substrates. The present sequence is not given in the specification but is that of human PTP-PEST protein sequence taken from Genbank (Accession Number; XP034191). The present sequence was used to generate mutants D199A (AAMS1201) and C231S (AAMS1202) as described in the specification. Note: An alternative sequence for human PTP-PEST is given in figure 1 of the specification (AAG7821)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     123
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               125

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present protein sequence is that of the cytoplasmic, Lymphoid Protein Tyrosine Phosphatase Lyp1, that has a single catalytic domain. The non-acatalytic portion of the phosphatase contains unique sequences, including a single PEST sequence rich in Pro, Glu or Asp, Ser and Thr. Lyp1 is expressed in the lymphoid cells, particularly in thymcoytes, mature B and Iymphocyte growth and development and is phosphorylated in a cell cycle dependent manner. Lyp1 shares about 70% sequence identity with the murine phosphatase Z70PEP. Lyp proteins are important for regulation of T cell antigen and cytokine receptor signalling and for early and late stages of T cell differentiation. Lyp1 has immunosuppressive activity. Compounds that increase expression of Lyp protein can be used as immunosuppressive agents to reduce or prevent T cell activation or proliferation, to control thymcoyte differentiation and to treat autoimmune diseases and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New nucleic acid encoding intracellular tyrosine phosphatase and related proteins, used to modulate signaling through T cells, particularly as immunosuppressant.

Novel therapeutic agents for treating diseases which are related to cell proliferation, migration, inflammation and angiogenesis especially cancer

24; 91pp; English Claim 4; Fig

This is the amino acid sequence of mouse protein tyrosine phosphatase (PTP) PEST is a soluble PTP that is ubiquitously expressed throughout embryonic development and in murine adult tissues. The Netroughout embryonic development and in murine adult tissues. The Netroughout embryonic development and in murine adult tissues. The Netroughout embryonic development and in murine adult tissues. The Netroughout embryonic of composed of 5 proline rich domain, while the Composular proline side for the adaptor protein Shor. The pro 2 domain is required for paxillin binding and the synthesis of mutant PTP-PEST have shown that proline 322 is important for paxillin binding activity. The invention relates to a compound that is capable of interfering with the binding of PTP-PEST to signalling molecules that are involved in cell migration, adhesion or division. The compound can be derived from minimal expresses the wild type form of PTP-PEST. The invention also relates to a method for finding a genuine substrate for an enzyme in a cell that normally expresses the wild type form of the enzyme. A mutant version of PTP-PEST (see AAY67251 and AAY67253) is used in this method. The compounds have cytostatic and antiniflammatory activity. The compounds can be used for making medicaments for treating a disease related with cell proliferation, migration, inflammation and angiogenesis, especially cancer. The novel method is used for identifying a genuine substrate for an enzyme
